

Metal Industry Indicators

Indicators of Domestic Primary Metals, Steel, Aluminum, and Copper Activity

March 2003

The primary metals leading index registered a slight decrease in February, but its growth rate remained positive, suggesting weak growth in U.S. metals industry activity in the short term. The leading index of metal prices moved up in January. However, geopolitical uncertainties cloud the prospects for the global economy and metals demand.

The **primary metals leading index** dipped a modest 0.2% in February, down to 129.3 from an upwardly revised 129.6 in January. The index's 6-month smoothed growth rate slowed to 0.3% from a revised 1.0% in January. The 6-month smoothed growth rate is a compound annual rate that measures the near-term trend. Normally, a growth rate above +1.0% signals an upward trend for future growth in metals activity, while a rate below -1.0% indicates a downward trend.

Only four of the leading index's eight components were available in time to compute the February index value. The index will be revised next month when the remaining four components are added. Two components, the Institute for Supply Management's PMI, an index of manufacturing activity, and the stock price component, which combines the S&P stock price indexes for construction and farm machinery companies and for industrial machinery companies, decreased in February. In contrast, the length of the average workweek in primary metals establishments and the JOC-ECRI metals price index growth rate moved higher.

While not yet signaling a downturn in industry activity, the growth rate of the primary metals leading index has slowed dramatically in the past year, suggesting weak growth in the overall U.S. metals industry in the short term.

The **steel leading index** followed its huge gain in December with an even greater drop in January, the latest month for which it is available. The index fell 2.7% to 111.4 from a revised 114.5 in December, marking its largest 1-month decrease since October 1981. Meanwhile, the index's 6-month smoothed growth rate slumped to -2.1% from a revised 3.5% in December. A 1.7-hour reduction in the length of the average workweek in steel mills, the largest decrease in almost 28 years, was responsible for almost half of the net decline in the leading index. Decreases in retail sales of U.S. passenger cars and light trucks and in shipments of household appliances accounted for most of the remainder of the net decline. January's unusually large drop in the leading index

would be more alarming if it did not come right on the heels of a similarly large increase in December. With the rather extreme December and January movements in the index offsetting each other, the growth rate of the steel leading index points to slower growth in domestic steel industry activity in the coming months.

The **aluminum mill products leading index** edged up 0.1% in January to 172.1 from a revised 172.0 in December, while the index's 6-month smoothed growth rate remained at the revised December reading of 2.4%. Although only two of the index's seven components increased in January, the largest increase in net new orders for aluminum mill products since February 1988 boosted the leading index. The sharp decrease in retail sales of U.S. passenger cars and light trucks made the largest negative contribution. The performance of the growth rate of the aluminum mill products leading index in the past 2 months suggests that increased growth in domestic industry activity is more likely in the coming months.

Following 3 months with strong gains, the **primary aluminum leading index** increased a modest 0.2% in January to 85.1 from a revised 84.9 in December. The index's 6-month smoothed growth rate slowed slightly to 5.9% from a revised 6.1% in December. The index of the trade-weighted average exchange value of other major currencies against the U.S. dollar was the largest factor in the net increase in the index. The growth rate of the leading index continues to signal growth in the U.S. primary aluminum industry in the months ahead.

The **copper leading index** declined 0.6% in January to 115.1 from a revised 115.8 in December, and its 6-month smoothed growth rate dipped to -3.0% from a revised -1.8% in December. A decrease in average weekly overtime hours in copper rolling, drawing, and extruding establishments made the largest negative contribution to the net decrease in the leading index, and the S&P stock price index for building products companies and the index of new housing permits also posted substantial declines.

The growth rate of the copper leading index signals continued near-term declines in U.S. copper industry activity.

Weaker U.S. Dollar Boosts Metals Price Leading Index

The **metals price leading index** gained 1.7% in January, the latest month for which it is available, moving up to 112.4 from a revised 110.5 in December. The index's 6-month smoothed growth rate rose to 1.4% from a revised -1.4% in December.

Three of the leading index's four components were available in time to compute the January index value. A big increase in the growth rate of the index measuring the trade-weighted average exchange value of other major currencies against the U.S. dollar made the greatest contribution to the increase in the leading index. The growth rate of the inflation-adjusted value of new orders for U.S. nonferrous metal products also posted a strong gain. The yield spread between the U.S. 10-year Treasury Note and the federal funds rate registered a slight increase.

The December metals price leading index was revised lower with the addition of the fourth component, the growth rate of the Economic Cycle Research Institute's (ECRI) 18-Country Long Leading Index. The ECRI index slumped to a 14-month low in December.

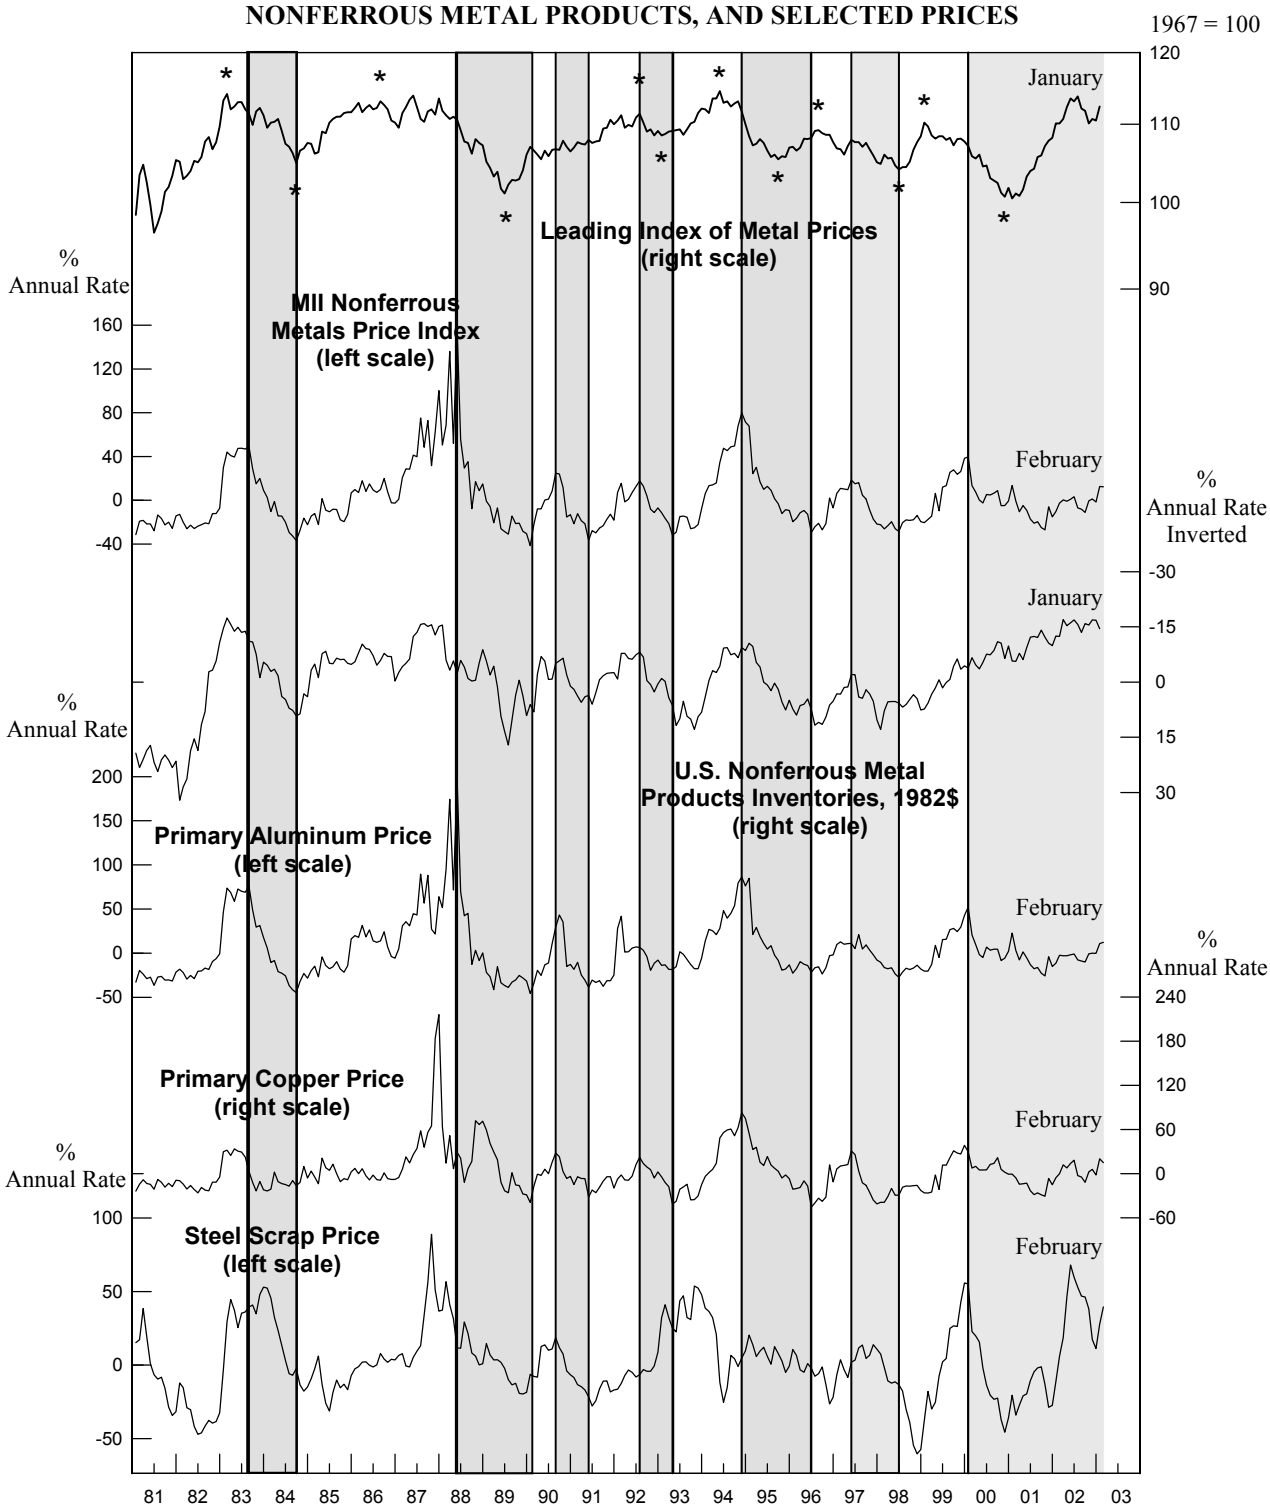

The growth rate of the inflation-adjusted value of inventories of U.S. nonferrous metal products increased to -14.5% in January from a revised -16.8% in December. This indicator typically moves inversely with metal prices. However, the actual level of these inventories decreased further in January.

The metals price leading index and U.S. nonferrous metal products inventories are not providing a clear signal of the near-term direction of metal prices. The business cycle and inventories are only two factors in metals price determination. Other factors that affect prices include changes in metals production, speculation, foreign exchange rates, strategic stockpiling, geopolitical instability, and production costs.

Table 1.

<i>NA: Not available r: Revised</i>						
Note:	The components of the Leading Index of Metal Prices are the spread between the U.S. 10-year Treasury Note and the federal funds rate, and the 6-month smoothed growth rates of the deflated value of new orders for nonferrous metal products, the Economic Cycle Research Institute's 18-Country Long Leading Index, and the reciprocal of the trade-weighted average exchange value of the U.S. dollar against other major currencies. The Metal Industry Indicators (MII) Nonferrous Metals Price Index measures changes in end-of-the-month prices for primary aluminum, copper, lead, and zinc traded on the London Metal Exchange (LME). The steel scrap price used is the price of No. 1 heavy melting. Inventories consist of the deflated value of finished goods, work in progress, and raw materials for U.S.-produced nonferrous metal products (NAICS 3313, 3314, & 335929). Six-month smoothed growth rates are based on the ratio of the current month's index or price to its average over the preceding 12 months, expressed at a compound annual rate.

Coincident: 1, Federal Reserve Board; 2, Bureau of Labor Statistics and U.S. Geological Survey; 3, U.S. Census Bureau and U.S. Geological Survey. All series are seasonally adjusted, except 2, 3, and 4 of the leading index.

NA: Not available r: Revised

Note: A component's contribution, shown in Tables 3, 5, 7, and 9, measures its effect, in percentage points, on the percent change in the index. Each month, the sum of the contributions plus the trend adjustment equals (except for rounding differences) the index's percent change from the previous month.

CHART 2.

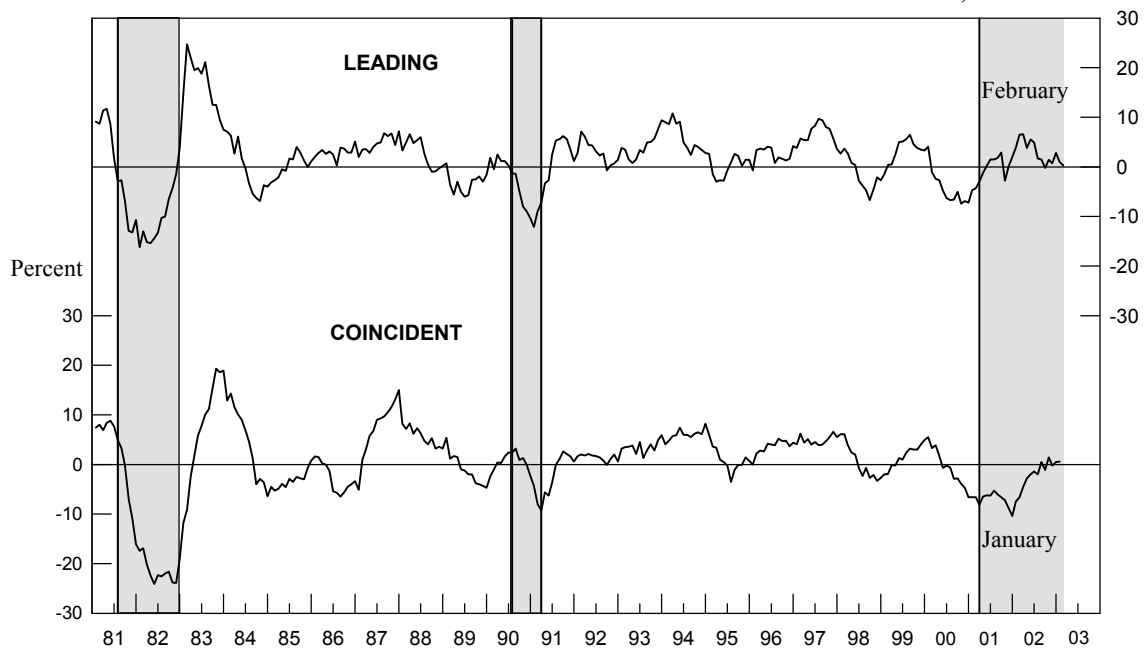

PRIMARY METALS: LEADING AND COINCIDENT INDEXES, 1981-2003 1977=100

Shaded areas are business cycle recessions. Asterisks (*) signify peaks (the end of an expansion) and troughs (the end of a downturn) in the economic activity reflected by the indexes.

CHART 3.

PRIMARY METALS: LEADING AND COINCIDENT GROWTH RATES, 1981-2003 Percent

Shaded areas are business cycle recessions.

The growth rates are expressed as compound annual rates based on the ratio of the current month's index to its average level during the preceding 12 months.

CHART 10.

PRIMARY ALUMINUM LEADING AND COINCIDENT INDEXES, 1981-2003 1977=100

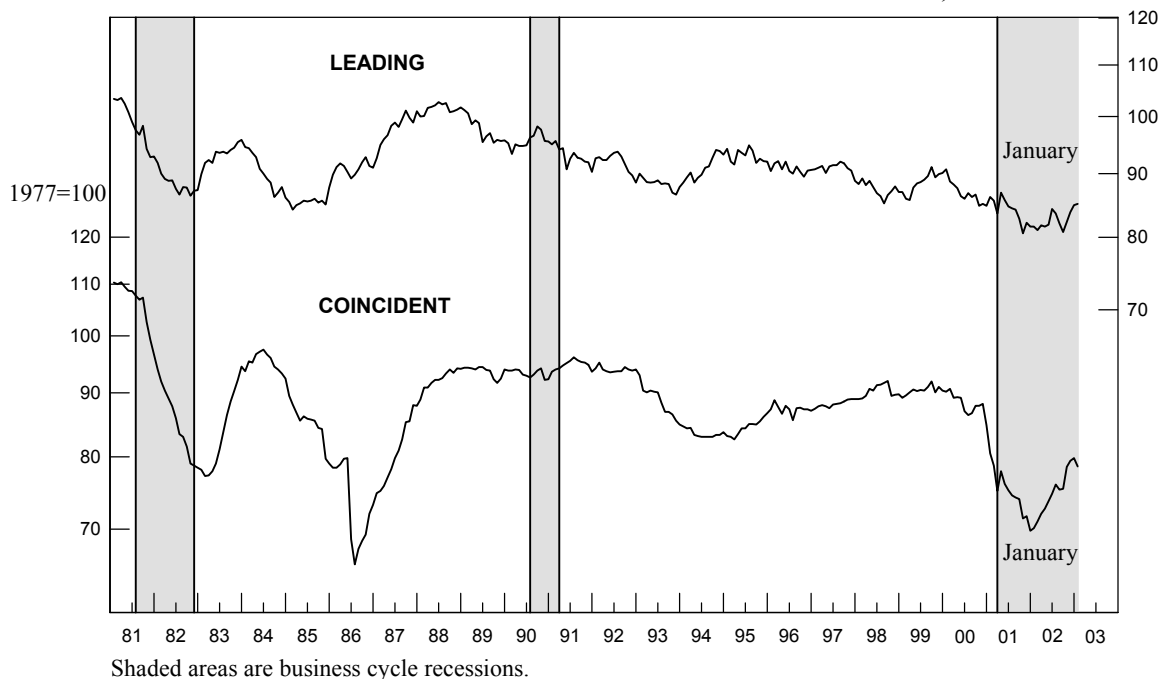

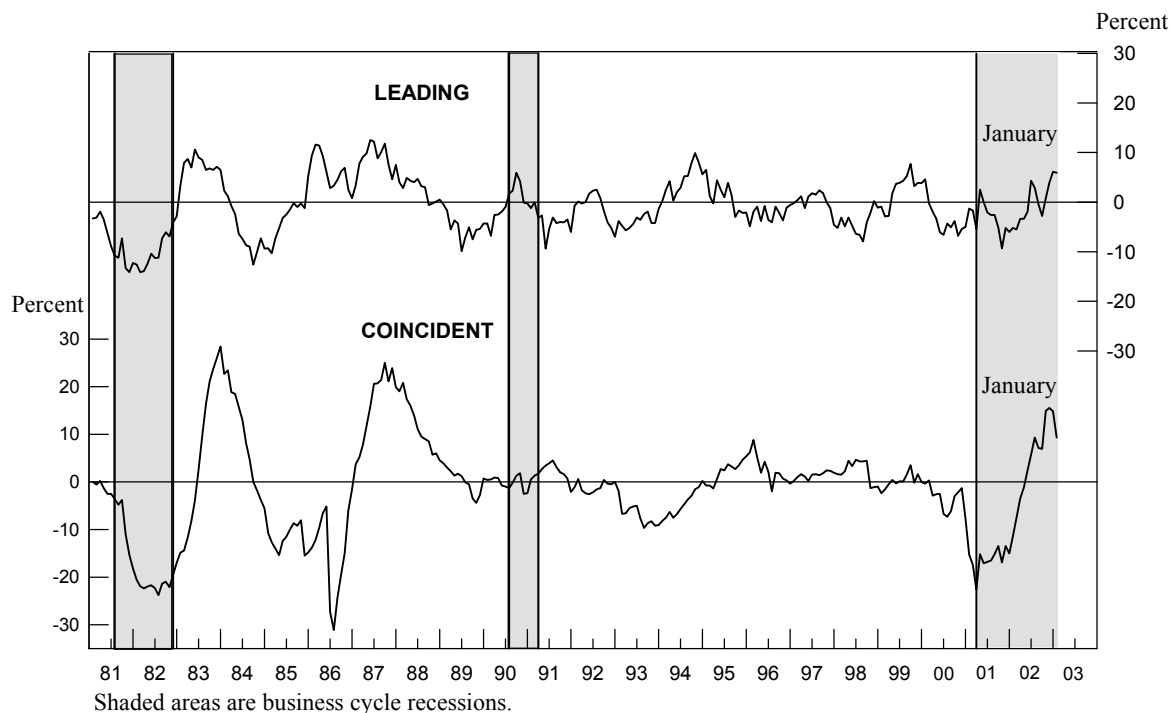

CHART 11.

PRIMARY ALUMINUM LEADING AND COINCIDENT GROWTH RATES, 1981-2003

The growth rates are expressed as compound annual rates based on the ratio of the current month's index to its average level during the preceding 12 months.

Explanation

Each month, the U.S. Geological Survey tracks the effects of the business cycle on five U.S. metal industries by calculating and publishing composite indexes of leading and coincident indicators. Wesley Mitchell and Arthur Burns originated the cyclical-indicators approach for the economy as a whole at the National Bureau of Economic Research in the mid-1930s. Over subsequent decades this approach was developed and refined, mostly at the National Bureau, under the leadership of Geoffrey H. Moore.¹

A business cycle can briefly be described as growth in the level of economic activity followed by a decline succeeded by further growth. These alternating periods of growth and decline do not occur at regular intervals. Composite indexes, however, can help determine when highs and lows in the cycle might occur. A composite index combines cyclical indicators of diverse economic activity into one index, giving decision makers and economists a single measure of how changes in the business cycle are affecting economic activity.

The indicators in the metal industry leading indexes historically give signals several months in advance of major changes in a coincident index, a measure of current metal industry activity. Indicators that make up the leading indexes are, for the most part, measures of anticipations or new commitments to various economic activities that can affect the metal industries in the months ahead.

Composite coincident indexes for the metal industries consist of indicators for production, shipments, and total employee hours worked. As such, the coincident indexes can be regarded as measures of the economic health of the metal industries.

The metal industry coincident indexes reflect industry activity classified by the U.S. Standard Industrial Classification (SIC) and the North American Industry Classification System (NAICS). Of the five metal industries, primary metals (NAICS 331) is the broadest, containing 25 different metal processing industries. Steel, aluminum, and copper are specific industries within the primary metals group.

The SIC was the main vehicle used by the U.S. Government and others in reporting industry economic statistics throughout most of the last century. Starting with the 1997 U.S. Economic Census, the U.S. Government began using the NAICS, which classifies economic data for industries in Canada, Mexico, and the United States. In general, metal industry indexes starting in 1997 begin to reflect the NAICS classification, while indexes for earlier years follow the SIC. Hence, composite indexes from 1997 forward are not entirely consistent with those of earlier years.

The largest change to primary metals because of the NAICS deals with other communication and energy wire manufacturing (NAICS 335929). Under NAICS, this manufacturing has been removed from primary metals and added to electrical equipment, appliance, and component manufacturing. Because monthly shipments and new orders for this wire are not available, the USGS is estimating their values from 1997 onward and adding them to the appropriate metal industry indicators and indexes to maintain consistency.

¹**Business Cycle Indicators, A monthly report from The Conference Board** (March 1996).

There are other small changes to the primary metals industry because of the switch to the NAICS. Coke oven activity not done by steel mills, for example, is removed and alumina refining, a part of industrial inorganic chemical manufacturing under the SIC, is added. Since the historic trends of the composite indexes are not affected by these small changes, the USGS is not making specific adjustments to the indexes for them for the periods before and after 1997.

The metal industry leading indexes turn before their respective coincident indexes an average of 8 months for primary metals and 7 months for steel and copper. The average lead time for the primary aluminum leading index is 6 to 8 months, and the average lead time for the aluminum mill products leading index is 6 months.

The leading index of metal prices, also published in the *Metal Industry Indicators*, is designed to signal changes in a composite index of prices for primary aluminum, copper, lead, and zinc traded on the London Metal Exchange. On average, this leading index indicates significant changes in price growth about 8 months in advance.

The growth rate used in the *Metal Industry Indicators* is a 6-month smoothed growth rate at a compound annual rate, calculated from a moving average. Moving averages smooth fluctuations in data over time so that trends can be observed. The 6-month smoothed growth rate is based upon the ratio of the latest monthly value to the preceding 12-month moving average.

$$\left[\left(\frac{\text{current value}}{\text{preceding 12-month moving average}} \right)^{\frac{12}{6.5}} - 1.0 \right] * 100$$

Because the interval between midpoints of the current month and the preceding 12 months is 6.5 months, the ratio is raised to the 12/6.5 power to derive a compound annual rate.

The growth rates measure the near-term industry trends. They, along with other information about the metal industries and the world economy, are the main tools used to determine the outlook of the industries. A 6-month smoothed growth rate above +1.0% usually means increasing growth; a rate below -1.0% usually means declining growth.

The next summary is scheduled for release on the World Wide Web at 10:00 a.m. EDT, Friday, April 18. The address for *Metal Industry Indicators* on the World Wide Web is: <http://minerals.usgs.gov/minerals/pubs/mii/>

The *Metal Industry Indicators* is produced at the U.S. Geological Survey by the Minerals Information Team. The report is prepared by Kenneth Beckman (703-648-4916; e-mail: kbeckman@usgs.gov), and Gail James (703-648-4915; e-mail: gjames@usgs.gov). The former Center for International Business Cycle Research, under the direction of Dr. Geoffrey H. Moore, and the former U.S. Bureau of Mines developed the metal industry leading and coincident indexes in the early 1990s. Customers can send mail concerning the *Metal Industry Indicators* to the following address:
